Developing a food recommendationfu nction

Final Report

Date: 23/12/24

Name: 이나경

ID: 231135

1. Introduction

1) Background

Food is something you have to eat every day, but each time you choose a menu, it takes a lot of time to choose a satisfactory menu. This leads to a decrease inbreakfast preparation time, lunch breaks, and work hours while thinking aboutmeals. We need a program that automatically recommends food to solve the problem of wasting time through eating concerns and to select a more satisfyingmenu.

2) Project goal

The goal is to recommend food menus based on food-specific ratings given bycustomers, reducing the time to think about food during meal times and allowingthem to select more satisfying menus.

3) Differences from existing programs

Existing programs recommend food lists that are already finished and cannot beedited. It is highly likely that foods that do not suit individual preferences willoften be recommended. We have a difference from the existing program in thatby applying a customization method in which customers directly add menus, words they want to leave, allergies, etc., they store only the information they need to make customized recommendations for that customer.

2. Functional Requirement

1) Function 1 Menu Recommendation Function

- Explanation: We recommend the food based on the rating given by thecustomer by the food.

(1) **Detailed function 1:** Select Category

- Explanation: Allows you to select the category in which you would like to berecommended for food.

(2) Detailed function 2: Save Memo

- Explanation: Save the words you want to leave on the recommended food, suchas recipes, precautions, and allergies.

(3) Detailed function 3: Save Preferences

- Explanation: Leave a preference for the recommended food and allow it to bereflected in the new food recommendations.

2) Function 2: Menu editing function

- Explanation: Ability to edit items or information on recommended food lists

(1) Detailed function 1: Add Menu

- Explanation: Add food and leave notes such as preferences.

(2) Detailed function 2: Delete Menu

- Explanation: Delete foods you don't want to be recommended again.

3) Function 3: File Storage Function

- Explanation: Upload the newly entered information, such as preferences andnotes, to the file.

3. Implementation

(1) Menu Editing Function - Add Menu

- Input; menus: a dictionary that stores categories, menus, and ratings. memos: a dictionary that stores menus and memos.

Output; The menu entered by the user and the menu added with rating Memos with memos corresponding to newly created menu

- Description: First, you get a category input, and if that category is not in the keys of menus, you get it back in. If a category exists, enter the menu and rating you want to add and save additional menus and ratings in menus and memos.
- What you've learned: Repeat statement, condition question, function, module, exception
- Code Screenshot

```
# 메뉴 추가

def add_menu(menus,memos):

while True: # 존재하지 않는 카테고리를 입력받는 경우 차단.

add_cate = input("메뉴 추가를 원하는 카테고리를 선택해 주세요. ")

if add_cate not in menus.keys():
    print("입력한 카테고리가 존재하지 않습니다. ")

else:
    break

add_menu = input("추가를 원하는 메뉴를 입력해 주세요. ")

while True: # 정수만 입력

try:
    add_rate = int(input("추가한 메뉴에 별점을 남겨 주세요. "))
    break
    except ValueError:
    print("숫자를 입력해 주세요. ")

input_memo = input("메모를 남기시겠습니까? (y/n)")

memo = " " # 메모를 남기지 않는 경우

if (input_memo == 'y'):
    memo = input("메모를 입력해주세요. ")

menus[add_cate][add_menu] = add_rate

memos[add_menu] = memo

print("menus", menus)

#print("memos", memos)
```

(2) Menu Editing Function - Delete Menu

- Input; menus: a dictionary that stores categories, menus, and ratings.

memos: a dictionary that stores menus and memos.

Output: Menus, where the selected menu is deleted, Memo from the selected menu also disappears.

- Description: Enter the category with the menu you want to delete first, and proceed with the deletion only if the category exists in the keys of the menu. Similarly, configure the deletion to proceed only when an incoming menu exists.
- What you've learned: Repeat statement, conditional statement, function, module
- Code Screenshot

```
# 메뉴 삭제

def del_menu(menus,memos):
    while True: # 존재하지 않는 카테고리를 입력받는 경우 차단.

    del_cate = input("삭제를 원하는 메뉴가 있는 카테고리를 선택해 주세요. ")
    if del_cate not in menus.keys():
        print("선택한 카테고리가 존재하지 않습니다. 다시 선택해 주세요. ")
        continue
    else:
        break

print(*menus[del_cate])
    while True:

    del_menu = input("삭제를 원하는 메뉴를 선택해 주세요. ")
    if del_menu not in menus[del_cate]:
        print("해당 카테고리에 존재하지 않는 음식입니다. ")
        continue
    else:
        break

del menus[del_cate][del_menu]
    del memos[del_cate](del_menu]
    del memos[del_menu]
    print("삭제가 완료되었습니다. ")
```

(3) File Storage Function

- Input; menus: a dictionary that stores categories, menus, and ratings.

memos: a dictionary that stores menus and memos.

Output: Save to a file reflecting the facts you have added or deleted, And the information you've modified your ratings and memo on your recommendation. Returns the file where the results are stored.

- Description: Create a data frame by extracting Category, Menu, and Rats information from each item in menus. Create another data frame by extracting Menu, Memo information from each item in Memos. Merge the two data frames and save the final data frame as a csv file.
- What you've learned: pandas, Repeat statement
- Code Screenshot

(4) Menu Recommendation - Select Category, Save Memo, Save Preferences

- Input; menus: a dictionary that stores categories, menus, and ratings.

memos: a dictionary that stores menus and memos.

Output: Menus and memos with newly changed and saved memos and prepernets for recommended menus

- Description: Enter the category for which the menu is recommended, and create a referral_menus that stores only the menus and ratings that correspond to that category in the menus.

In the Recommend Menu function, mix the order of referral_menus and loop each weight to select one random menu.

Specify a new rating on the selected menu and optionally leave a memo. You can be recommended again if you want.

- What you've learned: Repeat statement, conditional statement, function, module, exception
- Code Screenshot

```
# 메뉴 추천.

def RecommendMenu(recommend_menus):
  total_weight = sum(recommend_menus.values()) # rating 종합
  rand_val = random.uniform(0,total_weight) # 0~ total weight 사이 무작위 실수 추출.

shuffled_rating = list(recommend_menus.items())
  random.shuffle(shuffled_rating) # ratings를 랜덤으로 섞은 shuffled_rating 반환.
  shuffled_rating = dict(shuffled_rating)
  print("shuffled_rating",shuffled_rating)

current_weight = 0 # 조기화
  for menu,rating in shuffled_rating.items():
        current_weight += rating # 뒤로 갈수록 점점 확률이 높아짐, 자체 선호도가 높아도 추천 확률 높아짐.
        if rand_val <= current_weight: # 누적 선호도가 랜덤 값보다 높아지는 순간 선택.
        return menu
```

4. Test Result

(1) Add Menu

- Description: Test to see if the menu and ratings have been added as normal.
- Test Results Screenshot

5. Changes in Comparison to the Plan

No changes

6. Lessons Learned & Feedback

I left a lot of regrets about what I did wrong about the project, but I think it was a good experience and a good class.
